Headline Manica Drill Results -Replace
Released 09:35 20-Apr-06

The following amends the Manica Drill Results announcement released on 20th April 2006 at 8:44am, under RNS number 7173B. The figure stating the Manica verified resource should read 1.056Moz and not 1.56Moz as previously stated.

20th April 2006

Pan African Resources plc

(“Pan African” or “the Company”)

DRILL RESULTS – MANICA GOLD PROJECT IN MOZAMBIQUE

Pan African Resources plc (AIM: PAF), the African based exploration company, reports the results of a recent drilling programme completed at the Manica project in Mozambique.

The drilling programme was undertaken to provide samples for metallurgical test work as part of the ongoing pre-feasibility study at the Fair Bride gold prospect. A near-surface in situ resource of 852,747oz (8.47mt @ 3.13g/t) has been independently verified at the Fair Bride prospect with a total independently verified resource at Manica of 1.056Moz.

The following composite intersections are highlighted, widths reported are as intersected in borehole;

19.32m @ 5.02g/t (borehole MDD001, from 66.05m – 85.37m),

17.67m @ 6.56g/t (borehole MDD002, from 98.50 – 116.17m),

12.57m @ 1.17g/t (borehole MDD003, from 105.72 – 118.29) and

9.40m @ 2.55 g/t (Borehole MDD004, from 80.65 – 90.05m).

The individual results from the four boreholes drilled are tabulated below. Borehole MDD2 also intersected a previously unknown reef grading 4.88g/t over a width of 4.09m.

The metallurgical testwork is ongoing and it is expected that results will be completed by the end of Q3 2006.

Jan Nelson, CEO of Pan African commented; “The results from the infill drilling have exceeded our expectations and will allow us to upgrade the surface to near-surface resource at Fair Bride. We are finalising the results from the recently completed dipole-dipole geophysical survey which will form the basis for future exploration activity at Manica. I look forward to reporting the results

of that survey in the next few weeks. The Company is gearing up for a large exploration programme to assess Manica's potential to host a multi-million ounce gold deposit. To date we have only explored 12% of the mineralized strike-length, we will now turn our attention to the 88% that is unexplored.”

Borehole number	From	To	Width (m)	Grade (g/t)
MDD001	66.05	67.05	1.00	10.90

Reported width in table above refers to intersected width in borehole and not true width.

Grade (g/t) is reflected as average grade.

The core was logged and sampled by Patrick Charles and Denis Napido, Geological Consultants to the Company on site at the Manica project in Mozambique. Core samples were transported to South Africa and assayed at SGS Lakefield in South Africa, a SANAS (T0169) accredited laboratory.

The data in this announcement has been independently verified and checked for the reporting of exploration drill results by the company's competent persons, Garth Mitchell and Graham Gavine, of ExplorMine Consultants (Pty) Ltd. Both geologists are SACNASP registered and members in good standing of their professional societies and have no direct or indirect interest in Pan African Resources plc.

Notes to Editor

ExploreMine Gold Consultants (Pty) Ltd is a South African based Resources & Geological Consultancy – the principle directors and geologists of the company are Graham Gavine and Garth Mitchell.

SACNASP – South African Council for Natural Scientific Professions.

SANAS – South African National Accreditation System.
